Frame 1

BASIC CELLULAR SYSTEM

There are mainly two types of Basic Cellular System:

1. Circuit Switched

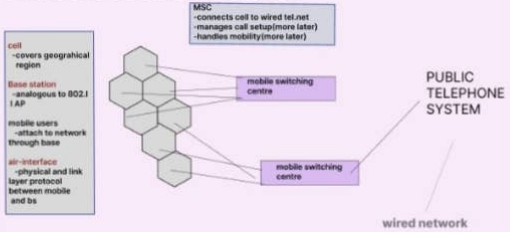

In a circuit-switched system, each traffic channel is dedicated to a user until its call is terminated.

2. Packet Switched

In packet switching, data is divided into packets. Each packet can travel through the network toward the destination.

Frame 2

Components of a basic cellular system

Frame 3

Analog Circuit Switched System

A basic analog cellular system consists of three subsystems:

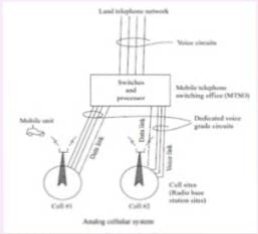

1.A Mobile Unit

2.A Cell site

3.A Mobile Telephone Switching Office(MTSO) with CONNECTIONS to link the three subsystems

Frame 4

Analog Circuit Swiched System

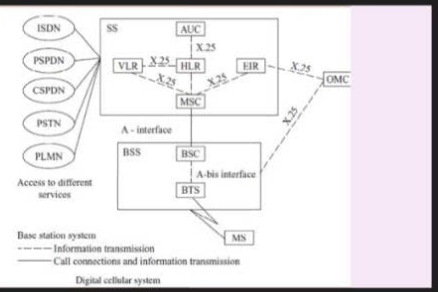

Digital Circuit-Switching system

A Basic digital system consists of four elements:

1.Mobile station
2.base transreceiver station(BTS)
3.base station controller(BSC)
4.switching subsystem

Frame 6

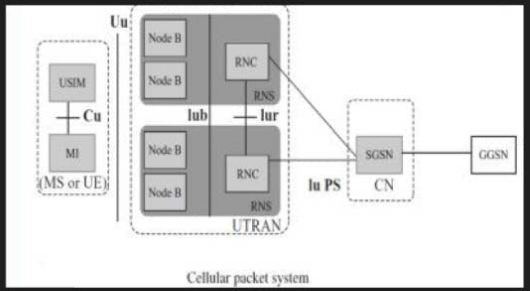

Frame 7

Packed Switching system

a cellular packet switching has six elements as follows

1.MS(Mobile station)
2.Node B
3.RNC(radio network cellular)
4.SGSN(Service GPRS Support Node)
5.GGSN(gateway GPRS support node)
6.CGN(Changing Gateway Functions
